1. If-then-else

A conditional is a test: 'if something is true, then do this, otherwise maybe do something else'. The C++ syntax is

```
if ( something ) {  
    // do something;  
} else {  
    // do otherwise;  
}
```

- The 'else' part is optional
- You can leave out braces in case of single statement.

2. Complicated conditionals

Chain:

```
if ( /* some test */ ) {  
    ...  
} else if ( /* other test */ ) {  
    ...  
}
```

Nest:

```
if ( /* some test */ ) {  
    if ( /* other test */ ) {  
        ...  
    } else {  
        ...  
    }  
}
```

3. Comparison and logical operators

Here are the most common logic operators and comparison operators:

Operator	meaning	example
==	equals	<code>x==y-1</code>
!=	not equals	<code>x*x!=5</code>
>	greater	<code>y>x-1</code>
>=	greater or equal	<code>sqrt(y)>=7</code>
<,<=	less, less equal	
&&,	and, or	<code>x<1 && x>0</code>
and,or	and, or	<code>x<1 and x>0</code>
!	not	<code>!(x>1 && x<2)</code>
not		<code>not (x>1 and x<2)</code>

Precedence rules of operators are common sense. When in doubt, use parentheses.

Exercise 1

The following code claims to detect if an integer has more than 2 digits.

Code:

```
// basic/if.cpp
int i;
cin >> i;
if ( i>100 )
    cout << "That number " << i
         << " had more than 2
         digits"
         << '\n';
```

Output:

```
... with 50 as input
    ↪....
... with 150 as
    ↪input ....
That number 150 had
    ↪more than 2
    ↪digits
```

Fix the small error in this code. Also add an 'else' part that prints if a number is negative.

You can base this off the file `if.cpp` in the repository

Review quiz 1

True or false?

- The tests `if (i>0)` and `if (0<i)` are equivalent.

/poll "Same tests: 'i>0' and '0<i' ?" "T" "F"

- The test

```
if (i<0 && i>1)
    cout << "foo"
```

prints foo if $i < 0$ and also if $i > 1$.

/poll "'if (i<0 && i>1)' is true if i negative and if i greater than one" "T" "F"

- The test

```
if (0<i<1)
    cout << "foo"
```

prints foo if i is between zero and one.

/poll "'if (0<i<1)' true if i between 0 and 1" "T" "F"

Review quiz 2

Any comments on the following?

```
bool x;  
// ... code with x ...  
if ( x == true )  
    // do something
```

Exercise 2

Read in an integer. If it is even, print 'even', otherwise print 'odd':

```
if ( /* your test here */ )  
    cout << "even" << '\n';  
else  
    cout << "odd" << '\n';
```

Then, rewrite your test so that the true branch corresponds to the odd case.

Exercise 3

Read in a positive integer. If it's a multiple of three print 'Fizz!'; if it's a multiple of five print 'Buzz!'. It is a multiple of both three and five print 'Fizzbuzz!'. Otherwise print nothing.

Note:

- Capitalization.
- Exclamation mark.
- Your program should display at most one line of output.

Prime Project Exercise 4

Read two numbers and print a message stating whether the second is as divisor of the first:

Code:

```
// primes/divisiontest.cpp
int number, divisor;
bool is_a_divisor;
/* ... */
if (
/* ... */
) {
    cout << "Indeed, " <<
        divisor
        << " is a divisor of
        "
        << number << '\n';
} else {
    cout << "No, " << divisor
        << " is not a
        divisor of "
        << number << '\n';
```

Output:

```
( echo 6 ; echo 2 )
    ↪ | divisiontest
Enter a number:
Enter a trial
    ↪ divisor:
Indeed, 2 is a
    ↪ divisor of 6

( echo 9 ; echo 2 )
    ↪ | divisiontest
Enter a number:
Enter a trial
    ↪ divisor:
No, 2 is not a
    ↪ divisor of 9
```

4. Local variables in conditionals

The curly brackets in a conditional allow you to define local variables:

```
if ( something ) {  
    int i;  
    .... do something with i  
}  
// the variable `i' has gone away.
```

Good practice: only define variable where needed.

Braces induce a scope.

5. Conditional with initializer

Variable local to the conditional:

Code:

```
// basic/ifinit.cpp
if ( char c = getchar();
    c!='a' )
    cout << "Not an a, but: "
          << c
          << '\n';
else
    cout << "That was an a!"
          << '\n';
```

Output:

```
for c in d b a z ;
    ↪do \
    echo $c |
    ↪./ifinit ; \
done
Not an a, but: d
Not an a, but: b
That was an a!
Not an a, but: z
```

Exercise 5

Write a function `float read_number()` and use it in a conditional.

```
if ( /* something */ ) {  
    cout << "The root of this non-negative number is: "  
        << sqrt(number) << '\n';  
else  
    cout << "Number was negative\n";
```

Make sure to use an initializer; *number* should be limited in scope to the conditional.

6. Bitwise operations

Code:

```
// basic/bitor.cpp
int x=6,y=3;
cout << "6|3 = " << (x|y) <<
    '\n';
cout << "6&3 = " << (x&y) <<
    '\n';
```

Output:

```
6|3 = 7
6&3 = 2
```

Exercise 6

How would you test if a number is odd or even with bitwise testing?

7. Switch statement example

Cases are executed consecutively until you 'break' out of the switch statement:

Code:

```
// basic/switch.cpp
switch (n) {
case 1 :
case 2 :
    cout << "very small"
        << '\n';
    break;
case 3 :
    cout << "trinity" <<
        '\n';
    break;
default :
    cout << "large" <<
        '\n';
}
```

Output:

```
for v in 1 2 3 4 5 ; do \
    echo $v |
    ↪ ./switch ; \
    done
very small
very small
trinity
large
large
```
